YAESU MUSEN CO., LTD.

This manual is intended to serve as a supplement to the FT-4700RH Operating Manual. Detailed information regarding functions, specifications, options and operation has been provided in the Operating Manual, and is not reprinted herein. Therefore, this supplement is not intended to serve as an independent reference, but to be used in conjunction with the information provided in the Operating Manual.

Because of the compactness and complexity of the double-sided glass-epoxy circuit boards used in the FT-4700RH, four layout diagrams are provided for each board. Each side of the board is identified by the type of the majority of components installed on that side. In most cases one side has only chip components, and the other has either a mixture of both chip and lead components (trimmers, coils, electrolytic capacitors, packaged ICs, etc.), or lead components only. The two "obverse" views depict the board as it is seen when viewed directly with the eye, while the two "reverse" views depict the unseen side of the board as it would appear if one were to peer through the board from the other side without seeing the components on the near side.

While we believe the technical information in this manual is correct, Yaesu assumes no liability for damage that may occur as a result of typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated.

Yaesu Musen reserves the right to make changes in the circuitry of this transceiver, in the interest of technological improvement, without notification of the owners.

# CIRCUIT BOARD ACCESS

## Top Cover

Removing the top cover gives access to the VHF boards and one half of the Control Unit. To remove the top cover, remove the six screws denoted by stars in Figure 1.

## Bottom Cover

Removing the bottom cover gives access to the UHF boards and the other half of the Control Unit. To remove the bottom cover, remove the six screws denoted by double rings in Figure 1, and then separate the cover slowly to avoid straining the loudspeaker wires. These can be unplugged from the UHF Main Unit before pulling the cover away.

## Front Panel

The front panel is removed by removing the top and bottom covers, as described above, and then unplugging the control cable from the rear of the front panel (Figure 4).

To open the Front Panel/Controller, refer to Figure 5. Remove the screw in the rear of the unit, and then carefully pry the rear cover off using a wide-blade screwdriver. Four catches hold the cover in place: two each top and bottom. Do not squeeze the edges of the unit while prying the cover off.

The high reliability of the chip components in the FT-4700RH minimize the possibility that repair or realignment should be needed after leaving the factory. However, if damage occurs and some parts subsequently be replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

Because of the compact circuitry of this model, we recommend servicing only by authorized Yaesu service technicians who are experienced with the circuitry and fully equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the transceiver was purchased for instructions regarding repair. Authorized Yaesu service technicians realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing any faulty components.

Those who do undertake any of the following alignments are cautioned to do so at their own risk. Yaesu reserves the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

No alignment should be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy.

A 50-ohm dummy load that is non-reactive up to 450 MHz must be used. Correct alignment is not possible with an antenna.

## Alignment Equipment

- DC voltmeter (at least 20-kilohms/volt)
- 450 MHz standard signal generator (SSG) with calibrated output level and modulation (see note below)
- AF signal generator
- SINAD meter (SINADDER)
- FM linear detector (deviation meter)
- CM coupler (directional coupler)
- RF wattmeter (50W,  $\pm 5\%$  @ 450MHz)
- 50-ohm non-reactive (@450 MHz) dummy load
- Frequency counter (100Hz res. @450MHz)
- Oscilloscope (recommended, not required)

Note: SSG levels referred to in the alignment procedure are based on  $0\text{dBu}=0.5\text{uV}$ .

## Alignment Precautions

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 20 and 30°C (68 to 86°F). When the transceiver is brought into the shop it should be allowed at least 2 hours for thermal equalization before alignment.

Alignments must not be made unless the oscillator shields and circuit boards are firmly affixed in place. Also, the frequency counter must be thoroughly warmed up before beginning.

Supply voltage during alignment must be held constant at 13.8V DC. Use a well regulated, adjustable power supply capable of at least 10A continuous load.
